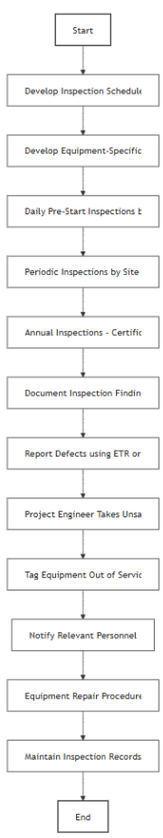
	PROCEDURAL MANUAL	
	EQUIPMENT INSPECTION	

OBJECTIVE	This procedure outlines the process for regularly inspecting construction equipment owned or leased by BHBI. The aim is to ensure that all equipment is in safe working order, identify potential problems before they lead to breakdowns or accidents, and comply with relevant safety regulations.
SCOPE	This procedure applies to all construction equipment used on BHBI projects, including but not limited to: • Excavators • Loaders • Dozers • Cranes • Generators • Compactors • Aerial Lifts • Forklifts • Other heavy equipment • Vehicles used for material and personnel transport .

Responsibilities

- **Project Engineer:** Responsible for overseeing equipment inspections on their projects and ensuring that inspections are carried out according to schedule. Also responsible for taking equipment out of service if it fails inspection and is deemed unsafe.
- **Site Engineer:** Responsible for coordinating and overseeing on-site equipment inspections.
- **Safety Officer:** Responsible for ensuring that equipment inspections incorporate all relevant safety checks and comply with safety regulations.
- **Logistics Personnel:** Responsible for maintaining equipment inspection records and coordinating with external service providers for specialized inspections, if needed. Also responsible for receiving and acting upon "Equipment Defect Reports" for non-operational equipment.
- **Equipment Operators:** Responsible for conducting daily pre-start inspections of equipment, reporting any defects or concerns using the ETR or the Equipment Defect Report, and cooperating with maintenance personnel.
- **External Service Providers:** Responsible for conducting periodic or specialized inspections as required by regulations or BHBI policy (e.g., annual crane inspections).

Flowchart



Procedure

4.1. Inspection Schedule:

- **Daily Pre-Start Inspections:** Equipment operators conduct daily pre-start inspections before operating equipment, as outlined in the *Procedure for Heavy Equipment Usage*. These inspections focus on basic safety and operational checks (e.g., fluid levels, tire pressure, lights, brakes, safety devices).

- **Deliverables:** Daily Pre-Start Inspection Checklists, Equipment Time Record (ETR)
- **Periodic Inspections:** The Site Engineer or designated personnel conduct more thorough inspections at regular intervals (e.g., weekly, monthly, quarterly) based on equipment type, usage, and manufacturer recommendations. These inspections should be documented.
  - **Deliverables:** Periodic Inspection Checklists, Equipment Inspection Reports
- **Annual Inspections/Certifications:** Certain equipment may require annual inspections or certifications by qualified external service providers (e.g., cranes, lifting equipment) to comply with regulatory requirements.
  - **Deliverables:** Annual Inspection Certificates

4.2. Inspection Checklists:

- **Develop Checklists:** The Safety Officer, in coordination with the Project Engineer and Site Engineer, develops specific inspection checklists for each type of equipment, outlining the items to be inspected and the acceptance criteria. These checklists should be based on:
  - Manufacturer's recommendations
  - Relevant safety regulations
  - BHBI's safety policies
  - **Deliverables:** Equipment-Specific Inspection Checklists
- **Checklist Content:** Refer to previously created procedure for the checklist content.

4.3. Inspection Process:

- **Visual Inspection:** Conduct a thorough visual inspection of the equipment.
- **Functional Tests:** Operate the equipment to check for proper function of all systems and controls.
- **Safety Checks:** Verify the operation of all safety devices.
- **Documentation:** Record inspection findings on the appropriate checklist, noting any defects or deficiencies found. Use clear and concise language to describe any issues. Also record findings on the ETR.
  - **Deliverables:** Completed Inspection Checklists, Equipment Inspection Reports, Equipment Time Record (ETR)
- **Defect Reporting:**
  - **Operational Equipment:** Equipment operators report any defects or malfunctions identified during pre-start checks or during operation to the Site Engineer using the ETR..
  - **Non-Operational Equipment:** If the equipment is found to be not in running condition during the pre-operation inspection, the operator must immediately inform Logistics Personnel and fill out an "Equipment Defect Report."
  - **Deliverables:** Equipment Time Record (ETR), Equipment Defect Report

4.4. Taking Equipment Out of Service:

- **Unsafe Equipment:** If a piece of equipment fails an inspection and is deemed unsafe to operate, the Project Engineer is responsible for immediately taking the equipment out of service.
- **Tagging:** Clearly tag the equipment as "Out of Service" or "Do Not Operate" to prevent unauthorized use.
- **Notification:** Notify relevant personnel (Site Engineer, operators, Logistics Personnel, etc.) that the equipment is out of service.
- **Repair:** Do not return the equipment to service until the necessary repairs have been made and the equipment has passed a follow-up inspection. (Refer to the *Equipment Repair Procedure*)

4.5. Record Keeping:

- **Inspection Records:** Logistics Personnel maintain records of all inspections performed, including dates, inspector names, equipment inspected, findings, and any corrective actions taken.
  - **Deliverables:** Equipment Inspection Records, Equipment Service History
- **Filing:** The Office Engineer is responsible for filing and archiving all physical inspection-related documents.

4.6. Training:

- **Operator Training:** Train equipment operators on how to conduct daily pre-start inspections, how to complete the ETR, and on defect reporting according to the *Procedure for Heavy Equipment Usage*.
- **Inspector Training:** Train designated inspectors (e.g., Site Engineer, Logistics Personnel) on how to conduct periodic inspections and use inspection checklists.

Continuous Improvement:

- Regularly review and update inspection procedures and checklists based on operating experience, manufacturer recommendations, and industry best practices.
- Analyze inspection reports to identify recurring problems and opportunities for improvement in maintenance practices.
