	PROCEDURAL MANUAL	
	SITE LOGISTICS AND PLANNING	

OBJECTIVE	This procedure outlines the process for planning and managing site logistics for BHBI construction projects. The aim is to ensure efficient and safe movement of materials, equipment, and personnel on site, optimize the use of site space, and minimize disruptions to construction activities.
SCOPE	This procedure applies to all BHBI construction projects and covers all aspects of site logistics, including site layout, access roads, traffic management, material storage, temporary facilities, security, and waste management. It starts from the project's mobilization phase and continues through to demobilization.

Responsibilities

- **Site Engineer:** Responsible for overseeing the inventory control process, including the activities of the Warehouseman, and ensuring that adequate stock levels are maintained on site.
- **Warehouseman:** Responsible for managing the day-to-day operations of the warehouse (or on-site storage), including receiving, storing, issuing, and tracking inventory in QNE. Reports to the Site Engineer.
- **Procurement:** Responsible for coordinating with the Site Engineer and Warehouseman to ensure timely replenishment of stock.
- **Project Engineer:** Responsible for overseeing inventory levels on their projects, in coordination with the Site Engineer, and ensuring that materials are available when needed.

Procedure

4.1. Inventory Management System (QNE):

- **QNE System:** Utilize the QNE software system to track material quantities, locations, and values.
    - **Deliverables:** QNE Inventory Data
- **Unique Identification:** Assign unique identification codes or SKUs (Stock Keeping Units) to each type of material within the QNE system.

4.2. Receiving and Put-Away:

- **Receiving:** When materials are received, follow the *Material Receiving and Inspection Procedure* to verify the delivery and inspect the materials.
- **Put-Away:** Store received materials in their designated locations in the warehouse or on-site storage area, following the *Material Storage and Handling Procedure*.
- **Inventory Update:** The Warehouseman updates the QNE system to reflect the receipt of new materials, including quantities, locations, and any relevant information (e.g., batch numbers, expiry dates).

4.3. Inventory Tracking:

- **Stock Levels:** The Warehouseman maintains accurate records of stock levels for all materials in the QNE system.
- **Inventory Transactions:** The Warehouseman records all inventory transactions in QNE, including receipts, issuances (using Material Withdrawal Slips as per the *Material Requisition and Issuance Procedure*), returns, and adjustments.
- **Real-Time Visibility:** Ensure that the QNE system provides real-time visibility of stock levels and material locations to authorized personnel, particularly the Site Engineer.

4.4. Inventory Counts:

- **Cycle Counting:** The Warehouseman conducts regular cycle counts (partial inventory counts) to verify the accuracy of QNE inventory records and identify any discrepancies.
    - **Deliverables:** Cycle Count Reports
- **Physical Inventory:** The Warehouseman conducts periodic full physical inventories (e.g., annually) to reconcile QNE inventory records with actual physical stock.
    - **Deliverables:** Physical Inventory Reports
- **Discrepancy Investigation:** The Warehouseman, with the assistance of the Site Engineer, investigates any discrepancies identified during cycle counts or physical inventories and takes corrective actions. Update QNE records accordingly.

4.5. Inventory Valuation:

- **Valuation Method:** Use a consistent method for valuing inventory (e.g., FIFO, weighted average) within the QNE system.
- **Costing:** Track the cost of each material in the QNE system.

4.6. Inventory Replenishment:

- **Reorder Points:** Establish reorder points for each material in QNE, based on lead times and usage patterns, in coordination with Procurement and the Site Engineer.
- **Replenishment Orders:** When stock levels fall below the reorder point, the Warehouseman notifies the Site Engineer, who then coordinates with Procurement to initiate the procurement process to replenish inventory, utilizing the QNE system for purchase requisitions (Refer to the *Procurement Procedure*).

4.7. Inventory Reporting:

- **Stock Reports:** The Warehouseman generates regular reports from QNE on stock levels, inventory values, and slow-moving or obsolete items, and provides these reports to the Site Engineer.
    - **Deliverables:** Inventory Reports
- **Management Review:** The Site Engineer, along with the Project Engineer and Procurement (if needed), reviews inventory reports to identify areas for improvement and make decisions regarding inventory management.

4.8. Security and Loss Prevention:

- **Access Control:** Implement security measures to restrict access to inventory storage areas and the QNE system.
- **Theft Prevention:** Take steps to prevent theft or loss of materials.
- **Damage Prevention:** Store materials properly to prevent damage or deterioration, following the guidelines in the *Material Storage and Handling Procedure*.
